Sharpening your hidden skills for a brighter future

Android App Development

Android app development is the process of creating applications for Android devices using languages like Kotlin or Java and tools such as Android Studio, or frameworks like React Native or Flutter. You'll learn to build intuitive user interfaces, manage app functionality, integrate APIs for data and services, and optimize apps for performance across diverse devices. Key skills include coding, debugging, and designing responsive layouts for smartphones, tablets, and wearables, enabling you to create engaging and functional apps.

Task 1: Simple Calculator App

Develop a basic calculator app that performs simple arithmetic operations like addition, subtraction, multiplication, and division. The app should have a clean and user-friendly interface with number buttons (0–9), operation buttons (+, -, ×, ÷), a clear button, and an equal button to compute results. Use any technology for the backend logic and XML for designing the layout. Ensure proper input validation and error handling, such as division by zero.

Task 2: PDF Viewer App

Design and implement a simple PDF Viewer Mobile App that allows users to open and read PDF files stored locally on their device. The app should support basic features such as file browsing, zooming, page navigation (next/previous), and remembering the last read page. Ensure the UI is clean and Responsive.

Submission Details:

- Make a ZIP or RAR file of the Code or any related things (if any), or share a GitHub repository link. Email it to submissions.archtech@gmail.com before the 27th of this month.
- For any technical queries or challenges faced during task completion, Email your questions to queries.archtech@gmail.com Our team will do our best to assist you.
